

IN THE CLAIMS:

This listing of claims will replace all prior versions, and listings, of claims in the application. Please cancel original claims 1-13, and add new claims 14-29 as follows:

Claims 1-13. (Cancelled)

14. (NEW) A video display system for a vehicle environment surveillance unit (0), including
- a video display (1),
 - at least one image sensor (3) for acquisition of environmental information,
 - a computer or processor (2) processing the acquired environment information into image information and displaying the results on the video display (1),
 - an intermediate memory (4) into which the image information is additionally recorded, and
 - comparison means including an image processing algorithm (5) via which the most recently recorded image is compared with the image information stored in intermediate memory and triggering a modification of the displayed video image on detecting an impermissible deviation between the most recently recorded image and the image information in the intermediate memory,
 - wherein, during comparison of the most recently recorded image with the image information in memory,

vehicle operating parameters (6) are additionally taken into consideration.

15. (NEW) A video image display system according to Claim 14, wherein the operating parameter (6) is a parameter which provides information regarding whether the vehicle is moving forwards or backwards or standing still.
16. (NEW) A video image display system according to Claim 14, wherein the operating parameter (6) is the vehicle speed.
17. (NEW) A video image display system according to Claim 14, wherein, in the case of an impermissible deviation between the most recently recorded image and the image information in memory, an error message is displayed on the video display (1).
18. (NEW) A video image display system according to Claim 14, wherein, in the case of an impermissible deviation between the most recently recorded image and the image information in memory, the video image display (1) is automatically switched off.
19. (NEW) A video image display system according to Claim 14, wherein for correction of the displayed video image a new image is acquired and the newly acquired image replaces the most recently recorded image.

20. (NEW) A video image display system according to Claim 14, wherein in the case that a re-initiation of the image recording is no longer possible, an error message is displayed on the video image display (1).
21. (NEW) A video image display system according to Claim 14, wherein in the case that a re-initiation of the image display is no longer possible, the video image display (1) is automatically switched off.
22. (NEW) A video image display system according to Claim 14, wherein the vehicle operator is informed regarding an impermissible deviation between the most recently recorded image and the image information in memory by a means independently of the video image display (1), which independent means is in communication with the vehicle environment surveillance unit (0).
23. (NEW) A video image display system according to Claim 22, wherein an optical display means is used as the warning means (7) providing optical signals for informing the vehicle operator.
24. (NEW) A video image display system according to Claim 22, wherein an acoustic output means is provided as the warning

means (7), providing acoustic signals for informing the vehicle operator.

25. (NEW) A video image display system according to Claim 14, wherein said vehicle environment surveillance system (0) is a night vision system.

26. (NEW) A video image display system according to Claim 14, wherein said vehicle environment surveillance system (0) is a system for locating a parking place.

27. (NEW) A method for displaying image information for a vehicle environment surveillance unit (0), said method comprising:

acquiring environmental information using at least one image sensor (3),

processing the acquired environment information with a computer or processor (2) into image information,

displaying the processed image information on a video display (1),

separately, storing the processed image information in an intermediate memory (4), and

comparing the most recently recorded image with the image information stored in intermediate memory using an image processing algorithm (5),

triggering a modification of the displayed video image on detecting an impermissible deviation between the most

recently recorded image and the image information in the intermediate memory,

wherein, during comparison of the most recently recorded image with the image information in memory, vehicle operating parameters (6) are additionally taken into consideration.

28. (NEW) A method according to Claim 27, wherein said vehicle environment surveillance system (0) is a night vision system.
29. (NEW) A method according to Claim 27, wherein said vehicle environment surveillance system (0) is a system for locating a parking place.
